

AIPIO INTELLIGENCE CONFERENCE

2018

SAVE THE DATE

21-23 August 2018 | QT Hotel, Canberra

“ **Integrated INTELLIGENCE** ”

COLLABORATION

Collaboration ensures that intelligence professionals working as a 'community' can achieve more than the sum of their individual efforts. Collaboration may be technologically-enabled but generates power by leveraging the fundamentally human nature of intelligence work. Collaboration across intelligence problems, domains, and agencies stimulates the development of quality intelligence products and services through sharing good practices, resources, and expertise while minimising duplication of effort and conflict.

TECHNOLOGY

Technology, as a powerful enabling instrument, may be both a boon and a bane. Building on the technology enablement theme of previous AIPIO national events, we will explore how the intelligence function can anticipate and make the best use of emerging and future technological advancements. We also recognise that nimble and well-resourced adversaries may use these technological advancements as means of attack or to otherwise support the achievement of their ends.

CAPABILITY

Capability emerges from an 'integrated intelligence' approach. Capability gives us the potential to shape our operating environments, and the agility to pivot towards new and emerging threats in a timely and effective manner. Capability development requires foresight, discipline and commitment - which also may challenge our established ways of working - as we confront the tides of change. Capability development is an investment in our future wellbeing as individual intelligence professionals as an intelligence community.
